1. Introduction

Animals that are killed for their flesh or are exploited for their procreation and secretions are often considered as an anonymous bulk. This makes it easy for people to lose connection and even though they are empathic and animal lovers they do not question that abuse. So one of the most interesting questions is, how many individuals per species are exploited and killed indirectly through consumption by an average person.

For land animals there are federal statistics on the total number of slaughter per species. However, those statistics include slaughter for exports. On the other hand live animals, meat, dairy products and eggs are imported in large numbers. In addition there is a considerable mortality rate of each species during breeding ranging from 3% for ducks to 21% for pigs. So, what are the real numbers per average consumer in Germany? This is even more difficult to answer for marine animals which are only measured in tonnes in most studies.

This analysis tries to find the most accurate numbers for Germany. It considers the direct killing of animals, the exploitation for dairy and eggs and some quantifiable animal suffering caused by optimized factory farming processes.

In the analysis, the adjusted annual values from various official studies are broken down to an average German consumer. These numbers are then extrapolated for 50 years to estimate how many lives can be saved (or better said "will not be bred and killed") by only one person changing to a plant based diet for 50 years.

This effect is then extrapolated for a conservative scenario in which at the average every 5 years each vegan inspires another person to go vegan (for calculation details see no. 23 in the final chapter).

This analysis only considers the effects of cutting out meat of most consumed species and dairy and eggs from an average person's diet (not rabbits, horses, deer, goats, etc.). It does not include considerations of all other animal exploitations and killings, e.g. for leather, fur, down, wool, animal testing, zoos, circuses, hunting.

Not considered either are the negative effects on the environment (CO₂, methan and N₂O emissions, rainforest deforestation, land usage, water consumption, soil degradation, use of pesticides, ocean dead zones, etc.), negative effects on people's health and negative effects on people especially in the third world (rising crop prices, drought, flooding, hurricanes, lack of water, etc.).

All sources and the main calculation methods are listed in the final chapter.

2. Results

2.1. Animals killed for eating

Animals killed for eating			
Land animals	pp per year ¹	in 20 years ²³	Exponential effect ²³
Chickens	10.60	192	689
Pigs	0.65	12	42
Turkeys	0.63	11	41
Ducks	0.43	8	28
Lambs	0.08	1	5
Cows	0.06	1	4
Totals	12.5	225	810
Freshwater and marine animals	pp per year ^{2,3,4}	in 20 years ²³	Exponential effect ²³
Food fish (Salmon, Herring, Tuna ...) incl. bycatch	23	411	1,476
Small fish for fishmeal and oil (avg. 42g)	208	3,760	13,504
Crustaceans, shells, molluscs (avg. 20g)	103	1,858	6,672
Totals	333	6,029	21,652

2.2. Animals killed and exploited for cheese, butter, milk and eggs

Animals killed and exploited for cheese, butter, milk and eggs			
Eggs	pp per year ^{5,6,7}	in 20 years ²³	Exponential effect ²³
Male chicks shredded	0.85	15	56
Eggs consumed	256	4,633	16,637
Laying hens used to death	0.57	10	37
Milk	pp per year ^{8,9,10,11,12}	in 20 years ²³	Exponential effect ²³
Milk (l) consumed (mainly cheese and butter)	358	6,478	23,264
Milk cows used permanently per person	0.05		
Milk cows consumed to death	0.02	0.33	1
Milk cows artificially inseminated	0.05	0.8	3
Calves taken from their mothers	0.05	0.83	3

2.3. Animal suffering due to optimized factory farming processes and mass demand

Animal suffering due to optimized factory farming processes and mass demand			
Piglets	pp per year^{13,14}	in 20 years²³	Exponential effect²³
Piglets castrated without anesthesia	0.2	3.6	13
Tails cut off from piglets without anesthesia	0.5	9	32
Cross-border live animal transports (only imports)	pp per year^{15,16,17,18}	in 20 years²³	Exponential effect²³
Poultry	3.2	59	211
Piglets	0.1	2.2	8
Pigs	0.04	0.7	3
Cows	0.002	0.0	0.2
Livestock	per person in every moment^{19,20,21,22}		
Fattened chickens, turkeys, ducks	1.75		
Laying hens	1.21		
Pigs	0.24		
Cows	0.19

<p>^{19, 20, 21, 22} (Number of animals kept in Germany MINUS export surplus) DIVIDED BY (number of German citizens MINUS vegetarians and vegans (depends on animal species))</p> <p>https://www.bmel.de/DE/Tier/Nutztierhaltung/Gefluegel/gefluegel_node.html 05/2018: https://www.destatis.de/DE/ZahlenFakten/Wirtschaftsbereiche/LandForstwirtschaftFischerei/TiereundtierischeErzeugung/Tabellen/Betriebe_Legehennenhaltung_Eiererzeugung_Legeleistung_nach_Haltungsformen_vorl_2018.html https://www.destatis.de/DE/ZahlenFakten/Wirtschaftsbereiche/LandForstwirtschaftFischerei/TiereundtierischeErzeugung/Tabellen/BetriebeSchweineBestand.html https://www.destatis.de/DE/ZahlenFakten/Wirtschaftsbereiche/LandForstwirtschaftFischerei/TiereundtierischeErzeugung/Tabellen/BetriebeRinderBestand.html 2016, laying & fattened hens, https://www-genesis.destatis.de</p>
<p>²³ The exponential effect is calculated based on the following conservative assumptions:</p> <ul style="list-style-type: none"> - at the average every vegan inspires one person to go vegan every 5 years (c=5) - the consumption of meat, dairy and eggs decreases every year by 1 % (d=1) per omnivore related to year zero, due to higher prices and more and more meat, dairy and egg substitutes (e.g. plant based and lab grown meat, dairy, eggs), i.e. in year 20 only 80% of meat, dairy and eggs are consumed per omnivore related to year zero - all vegans stay vegan, no one dies in the period considered - the exponential effect is only considered for 20 years (p=20), i.e. a person having turned vegan in year 5 cuts out animal products for 15 years, a person having turned vegan in year 15 only cuts out animal products for 5 years and a person having turned vegan in year 20 cuts out animal products for 0 years - the exponential effect is modelled using a first order linear recurrence system of this form (d=1): $x_0 = \frac{1}{100} \times \left(\sum_{k=100-p}^{100} k \right), x_n = x_{n-1} + 2^{n-1} \times \frac{1}{100} \times \left(\sum_{k=100-p}^{100-(n \times c)} k \right), (n = 1, 2, 3, \dots, \frac{p}{c}), (0 < c \leq p)$ <ul style="list-style-type: none"> - above recurrence system (including d) can be expressed for computational processing as: $x[0]: -(d * p^2 + (-d - 200) * p) / 200; x[n]: -x[n-1] + (2^{n-1}) * ((1/2) * (p - (c * n)) * (2 * (100 - d - p * d) + (p - c * n - 1) * d)) / 100; (n=1, 2, 3, \dots, p/c)$ - above recurrence system can be expressed as following function: $f(n) = - \frac{d \times 2^n \times p^2 + (-d - 200) \times 2^n \times p + (-c^2 \times d \times n^2 + ((2 \times c^2 + c) \times d + 200 \times c) \times n + (-3 \times c^2 - c) \times d - 200 \times c) \times 2^n + (3 \times c^2 + c) \times d + 200 \times c}{200}$ - above function can be expressed for computational processing as: $f(n) = -(d * 2^n * p^2 + (-d - 200) * 2^n * p + (-c^2 * d * n^2 + ((2 * c^2 + c) * d + 200 * c) * n + (-3 * c^2 - c) * d - 200 * c) * 2^n + (3 * c^2 + c) * d + 200 * c) / 200$ - the exponential effect of the above assumptions results in 16 vegans; if 50 years were considered the factor would grow to 1024 - due to the assumed shrinking consumption of animal products per omnivore, the saved animals x per vegan for 20 years is not 20 times x, but around 18.1 times x
